

PROJECT TITLE : AI FAQ ASSISTANT API

BRAINSTORMING AND IDEATION PHASE

1. PROBLEM IDENTIFICATION

The brainstorming phase focused on identifying common problems in customer support and FAQ management. The main issues identified were repetitive customer queries, time-consuming manual FAQ creation, difficulty in searching information, and the need for secure content management.

2. IDEAS CONSIDERED

The team considered several solutions, including centralized FAQ management, keyword-based search, role-based access, AI-powered FAQ generation, and secure REST API development.

3. SELECTED IDEA

The **AI FAQ Assistant** was selected as the final project idea. It provides a centralized system to create, manage, search, and organize FAQs. Google Gemini AI is used to generate FAQ questions and answers automatically.

4. TECHNOLOGIES SELECTED

The project uses **Node.js and Express.js** for backend development, **MongoDB and Mongoose** for data storage and validation, **JWT and bcrypt** for authentication and security, and **Google Gemini AI** for AI-powered FAQ generation.

5. IDEATION OUTCOME

The final idea was to develop a secure and intelligent FAQ management system that reduces manual work, improves information searching, and supports AI-assisted content creation.
