

PROJECT TITLE : AI FAQ ASSISTANT API

PROJECT TESTING PHASE

TESTING SETUP:

The AI FAQ Assistant was tested using Postman or Thunder Client to verify the functionality of the backend REST APIs. The server was started using `npm run dev`, and the required API endpoints were tested with suitable input data.

REGISTRATION TESTING:

The `POST /api/auth/register` API was tested with valid name, email, and password details to verify successful user registration.

LOGIN TESTING:

The `POST /api/auth/login` API was tested using registered user credentials to verify authentication and obtain the JWT token required for protected operations.

FAQ TESTING:

The `POST /api/faqs` API was tested with a valid JWT Bearer token and FAQ details such as question, answer, and category to verify FAQ creation.

SEARCH TESTING:

The `GET /api/faqs/search?q=configure` API was tested to verify that FAQs can be retrieved using keyword-based search.

AI TESTING:

The `POST /api/ai/generate-faq` API was tested with an authenticated request and a topic as input to verify AI-based FAQ generation using Google Gemini.

SECURITY TESTING:

Protected APIs were checked using JWT authentication, while schema validation and centralized error handling were used to maintain data integrity and provide standardized error responses.

TESTING RESULT:

The testing phase covered the major functions of the AI FAQ Assistant, including registration, login, authentication, FAQ creation, FAQ search, and AI-based FAQ generation, ensuring that the main backend operations work as intended.
